

Integrated Security Services

Need for Integrated Security

Protecting your information, reputation, assets, and people is a key leadership responsibility. However, with the increasing complexity of business and government, it is critical that security takes an integrated approach. This way, you never miss a piece of the puzzle (effectiveness) and implement only the right controls (efficiency).

Our uniquely integrated security teams makes us your one-stop security shop. We offer end-to-end security services, from the engineering and architecture all the way through to testing and audit, including cyber to physical and everything in between.

The Anchoram Difference

Our integrated approach steps beyond the standard siloed security solutions in order to address our clients' risks and issues holistically.

Effective security is multi-dimensional and requires a deep understanding of the interconnected nature of risk. Our uniquely integrated approach makes us your one-stop security shop.

The Anchoram Team

Making *Security* Expertise Accessible

Services Summary

Cyber Security

Effective cyber security is absolutely essential today. This includes the ability to *anticipate* incidents, *watch* for threats, and *withstand & recover* from security breaches. Threat assessments, security testing & assurance, code review, and architecture review can improve your cyber security posture.

OT Security

Threats to cyber-physical systems often mean life or death, and are no longer theoretical. Critical infrastructures and other operational technologies are often highly bespoke and require specialist care. Risk assessments, threat modelling, security health checks, and regulatory audits are necessary to maintain availability and maximise resilience.

Protective Security

Not having a clear and robust protective security strategy leads to reactive and expensive decisions, resulting in financial and reputational losses. This state of affairs is simply not sustainable. A comprehensive protective security framework includes aspects such as crisis management, risk and resilience, compliance, and security culture and policy assessment.

Security GRC

Governance, Risk, and Compliance activities provide insight into your organisation's security posture and tailored guidance on best practice within your operational context. We offer GRC services across a broad range of frameworks, including IRAP, ISO27001, and many other industry-specific standards.
